Challenge-4

Phua Zong Yao 2023-09-04

Questions

Load the "CommQuest2023.csv" dataset using the <code>read_csv()</code> command and assign it to a variable named "comm data."

```
# Enter code here
library(tidyverse)
```

```
## — Attaching core tidyverse packages —
                                                         — tidyverse 2.0.0 —

Question-1: Communication Chronicles

Using the select command, create a new dataframe containing only the "date," "channel," and "message" columns from the "comm data" dataset.

```
# Enter code here
select(comm_data,date,channel,message)
```

```
## # A tibble: 1,000 × 3
##
     date
                channel message
                <chr>>
                         <chr>>
##

                        Hello everyone!
## # i 990 more rows
```

Question-2: Channel Selection

Use the filter command to create a new dataframe that includes messages sent through the "Twitter" channel on August 2nd.

Solution:

```
# Enter code here
comm_data %>%
filter(channel == 'Twitter',date == "2023-08-02")
```

```
## # A tibble: 15 × 5
##
     date
                channel sender
                                                     sentiment
                                      message
##
     <date>
                <chr> <chr>
                                      <chr>>
                                                         <dbl>

                                                       0.602
## # i 990 more rows
```

Question-4: Distinct Discovery

Apply the distinct command to find the unique senders in the "comm_data" dataframe.

Solution:

```
# Enter code here

distinct(comm_data,sender)

## # A tibble: 6 × 1

## sender

## <chr>
## 1 dave@example

## 2 @bob_tweets

## 3 @frank_chat

## 4 @erin_tweets

## 5 alice@example

## 6 carol_slack
```

Question-5: Sender Stats

Employ the count and group_by commands to generate a summary table that shows the count of messages sent by each sender in the "comm_data" dataframe.

```
# Enter code here
comm_data %>%
count(sender, message)
```

```
## # A tibble: 36 × 3
     sender message
##
                                    n
     <chr> <chr>
##
                                 <int>
## 1 @bob_tweets Exciting news!
                                   30

                                   29
## 10 @erin_tweets Hello everyone!
                                   27
## # i 26 more rows
```

Question-6: Channel Chatter Insights

Using the group_by and count commands, create a summary table that displays the count of messages sent through each communication channel in the "comm data" dataframe.

Solution:

```
# Enter code here

comm_data %>%
  group_by(channel) %>%
  count()
```

Question-7: Positive Pioneers

Utilize the filter, select, and arrange commands to identify the top three senders with the highest average positive sentiment scores. Display their usernames and corresponding sentiment averages.

```
# Enter code here

comm_data %>%
  filter(sentiment>0) %>%
  group_by(sender) %>%
  summarise(average_psentiment=mean(sentiment)) %>%
  arrange(-average_psentiment) %>%
  slice(1:3) %>%
  select(sender,average_psentiment)
```

Question-8: Message Mood Over Time

With the group_by, summarise, and arrange commands, calculate the average sentiment score for each day in the "comm data" dataframe.

Solution:

```
# Enter code here

comm_data %>%
  group_by(date) %>%
  summarise(mean_sentiment = mean(sentiment)) %>%
  arrange(date)
```

```
## # A tibble: 20 × 2
           mean_sentiment
##
     date
##
     <date>
                        <dbl>

## 20 2023-08-20
                        0.0608
```

Question-9: Selective Sentiments

Use the filter and select commands to extract messages with a negative sentiment score (less than 0) and create a new dataframe.

```
# Enter code here

data_frame(comm_data %>%

Question-10: Enhancing Engagement

Apply the mutate command to add a new column to the "comm_data" dataframe, representing a sentiment label: "Positive," "Neutral," or "Negative," based on the sentiment score.

```
# Enter code here

comm_data %>%
  mutate(label = case_when(sentiment>0 ~ 'positive', sentiment==0 ~ 'neutral', sentiment<0 ~ 'n
  egative'))</pre>
```

```
## # A tibble: 1,000 × 6

Question-11: Message Impact

Create a new dataframe using the mutate and arrange commands that calculates the product of the sentiment score and the length of each message. Arrange the results in descending order.

Solution:

```
## # A tibble: 1,000 × 6
##
     date
              channel sender
                                     message
                                                     sentiment product
     <date>
                <chr>
                                                         <dbl>
                                                                 <dbl>

Question-13: Untidy data

Can you list at least two reasons why the dataset illustrated in slide 10 is non-tidy? How can it be made Tidy?

Solution:

In the percentage column, there is a combination of both percentages and population values. Also in the subject column, there are multiple variables included, which should not be the case as there should only be 1 variable in each column.

To make it Tidy, more columns should be created such as gender, employment status and age group should be created for the subject column. Also, avoid combining percentages and population values within the same column for the percentage column.
